The ATR 72 relies on two main sources of electrical power:

- Alternating Current (AC) Generators:** Each engine-driven generator supplies AC power, typically rated around 115V AC, 400Hz. These are mounted on the turboprop engines and are critical for primary power delivery.
- Auxiliary Power Unit (APU):** An APU provides supplemental power during ground operations and in case of main generator failure. It can supply both AC power and, depending on the configuration, bleed air for environmental systems.

Battery Systems

The aircraft is equipped with a dedicated 24V DC battery system to provide emergency power and support starting procedures. The battery is monitored continuously to ensure readiness.

Distribution and Bus Architecture

Main Buses

The ATR 72 utilizes several buses to distribute electrical power:

- Essential Bus:** Powers flight-critical systems, avionics, and flight instruments.
- Non-Essential Bus:** Supplies systems like lighting, galley equipment, and passenger amenities.
- Standby Bus:** Provides backup power to critical systems in case of primary bus failure.

Bus Transfer and Isolation

Automatic and manual transfer switches enable seamless switching between power sources and buses. Bus isolation ensures that faults in one segment do not propagate, maintaining overall system integrity.

Key Electrical Components

Circuit Breakers and Fuses

These protective devices prevent overloads and short circuits. The ATR 72's cockpit includes a dedicated panel for circuit breaker management, facilitating rapid troubleshooting.

Transformers and Rectifiers

Transformers step down AC voltage where necessary, while rectifiers convert AC to DC to power avionics and control systems.

Power Conversion Units

Power conversion units manage the conversion and regulation of electrical power, ensuring voltage stability across all systems.

Redundancy and Fail-Safe Features

Dual Generators and APU

Having two engine-driven generators and an APU ensures continuous power supply, even if one source fails. The system automatically switches loads to backup sources without pilot intervention in most cases.

Automatic Load Shedding

In emergency or fault conditions, non-essential loads are automatically disconnected to prioritize essential systems, preserving power for critical functions.

Backup Power Systems

The standby battery and backup buses serve as fail-safe mechanisms, providing power for essential systems during electrical failures.

Maintenance and Troubleshooting

Regular Inspection

Routine checks include battery health, generator output verification, and circuit breaker status. Maintenance schedules adhere to the manufacturer's recommendations and service bulletins.

Diagnostic Systems

Modern ATR 72 models are equipped with advanced fault diagnostic systems that alert pilots and maintenance crews to

electrical anomalies through cockpit alerts and maintenance data records.
