What Are Polymers?
Definition of Polymers Polymers are large molecules composed of repeating structural units called monomers. These monomers are linked together through covalent bonds, forming long chains or three-dimensional networks. The term "polymer" originates from the Greek words "poly," meaning many, and "meros," meaning parts, reflecting their nature as many-unit molecules.

Types of Polymers Polymers can be broadly classified into two categories:

- Natural Polymers:** Found naturally in the environment; examples include cellulose, proteins, and natural rubber.
- Synthetic Polymers:** Man-made through chemical processes; examples include polyethylene, polystyrene, and nylon.

Structure and Morphology of Polymers
Chain Structures The physical properties of polymers are heavily influenced by their chain structures:
