A dielectric with dielectric constant (k) is inserted between the plates. Calculate the new capacitance and the change in stored energy. Analysis: Initial Capacitance: $(C_0 = \frac{\epsilon_0 A}{d})$ With Dielectric: $(C = k C_0 = \frac{k \epsilon_0 A}{d})$ Stored Energy: $(U = \frac{1}{2} C V^2)$ The insertion of the dielectric increases the capacitance, leading to a proportional increase in stored energy if voltage remains constant. This question tests understanding of dielectric properties and energy storage.

Sample Breakdown: Typical Physics Problem and Its Solution

Problem Statement: A parallel-plate capacitor with plate area $A = 0.02 \text{ m}^2$ and plate separation $d = 0.001 \text{ m}$ is connected to a 12 V battery. Calculate the magnitude of the electric field between the plates, the capacitance, and the stored energy.

Solution:

Step 1: Calculate the electric field (E). Using the relation: $E = V / d$
 $E = 12 \text{ V} / 0.001 \text{ m} = 12,000 \text{ V/m}$

Step 2: Calculate the capacitance (C). Capacitance for a parallel-plate capacitor: $C = \epsilon_0 A / d$
 Where $\epsilon_0 = 8.854 \times 10^{-12} \text{ F/m}$
 $C = (8.854 \times 10^{-12} \text{ F/m}) \times 0.02 \text{ m}^2 / 0.001 \text{ m} = 1.77 \times 10^{-11} \text{ F}$

Step 3: Calculate the stored energy (U). $U = (1/2) C V^2$
 $U = 0.5 \times 1.77 \times 10^{-11} \text{ F} \times (12 \text{ V})^2 = 1.27 \times 10^{-9} \text{ Joules}$

Final Notes: The electric field magnitude is 12,000 V/m, directed from the positive to the negative plate. The capacitance is approximately 177 pF. The energy stored in the capacitor is roughly 1.27 nJ. Providing such detailed, stepwise solutions in the answer key ensures clarity and facilitates understanding for students reviewing their performance.
