Developed by Varian (now part of Agilent Technologies after acquisition), the AA 240 FS combines the company's legacy of precise optical systems with modern electronic controls, ensuring accuracy and ease of use. The manual operation design emphasizes user control over parameters, making it suitable for experienced analysts who prefer hands-on operation over automated systems. Design and Build Quality Robust Construction The Agilent AA 240 FS features a durable, compact chassis constructed from high-quality materials designed to withstand rigorous laboratory environments. Its ergonomic design facilitates ease of handling and maintenance, with

accessible compartmental layouts for components like the flame assembly, cathode lamps, and electronic modules. User Interface While primarily manual, the instrument includes a straightforward interface comprising: Control knobs and switches for adjusting flame parameters, lamp currents, and wavelength selection. Analog meters for real-time monitoring of flame stability and lamp status. Simple display panel providing essential operational feedback. This design caters to trained operators who appreciate tactile control and immediate visual cues, reducing reliance on complex software.

Core Features and Functionalities

Optical System At the heart of the AA 240 FS lies a high-precision optical system featuring a double-beam design. This configuration enhances measurement accuracy by compensating for fluctuations in light intensity, resulting in: Improved signal stability Reduced noise Enhanced sensitivity

The spectrometer employs a diffraction grating monochromator, allowing precise wavelength selection with high spectral resolution, vital for distinguishing elemental signatures.

Light Source and Lamps The instrument uses cathode lamps specific to each element under analysis. These lamps are: Selectable manually, allowing the operator to switch between elements. Long-lasting, with typical operational lifespans of several hundred hours. Adjustable in current, enabling optimization of intensity and signal strength.

Flame and Furnace Modes The AA 240 FS supports flame atomization, primarily using acetylene-air or acetylene-nitrous oxide flames, suitable for most metal analyses. It also accommodates graphite furnace atomization with manual control, providing: Higher sensitivity for trace elements Reduced sample size requirements Broader analytical range

The manual control over flame and furnace parameters offers flexibility but demands operator expertise.

Manual Operation Controls Unlike fully automated systems, the AA 240 FS emphasizes manual adjustment of key parameters: Flame height and flow rates via control valves Lamp current adjustment for optimal excitation Wavelength selection for specific elements Background correction methods, such as Zeeman or deuterium lamps, which can be manually enabled or disabled

This level of control enables experienced users to optimize conditions for specific samples, enhancing accuracy.

Analytical Performance and Sensitivity

Detection Limits The Agilent AA 240 FS provides detection limits suitable for routine analysis and trace element detection. Typical detection limits include: Lead (Pb): 0.1 mg/L Cadmium (Cd): 0.05 mg/L Copper (Cu): 0.02 mg/L

These figures are highly dependent on the specific element, sample matrix, and operational parameters.

Linearity and Precision The instrument offers excellent linearity over a broad concentration range, often up to 2-3 orders of magnitude, with correlation coefficients (R^2) exceeding 0.999. Precision tests under stable conditions generally report relative standard deviations (RSD) below 2% for replicate measurements.

Stability and Reliability Thanks to its high-quality optical components and robust construction, the AA 240 FS maintains stable readings over extended periods, reducing the need for frequent recalibration.

Operational Workflow

Sample Preparation Samples are typically prepared via digestion, dilution, or extraction to match the linear range of the instrument. The manual nature of the device demands meticulous sample handling and preparation for consistent results.

Calibration Manual calibration involves: Preparing standard solutions at known concentrations Adjusting lamp current and flame parameters for maximum signal Recording calibration curves for subsequent quantification

Operators can perform multi-point calibrations and verify linearity periodically.

Measurement Procedure Insert the appropriate cathode lamp for the target element. Set the wavelength manually using the

spectrometer controls. Adjust the flame parameters for sample type. Introduce the sample via a nebulizer or graphite furnace. Observe signal stability via the analog meters. Record absorbance readings and compare them with calibration curves.

Background Correction Manual background correction methods like Zeeman or deuterium lamps can be activated as needed, allowing for correction of non-specific absorption or scattering.
