Major Questions and Marking Points from the November 2013 Exam

Below, we analyze some representative questions from the November 2013 Physics 0625 exam, highlighting the marking points and strategies to approach them effectively.

Sample Question 1: Describe how a person can increase the electric current in a circuit. (4 marks)

Expected Answer and Marking Points: Increase the voltage (potential difference) supplied by the power source. Decrease the resistance in the circuit. Use a thicker wire (which has lower resistance). Connect components in parallel rather than in series to reduce overall resistance.

Tips: Mention the relationship $I = V / R$ explicitly. Highlight the importance of Ohm's Law. Provide clear reasoning for each point to gain full marks.

Sample Question 2: Calculate the speed of a wave with a frequency of 50 Hz and a wavelength of 3 meters.

Solution: Use the wave speed equation: $v = f \times \lambda$. $v = 50 \times 3 = 150$ m/s.

Marking Points: Correctly identifying the wave speed formula. Correct substitution of given values. Proper unit notation (meters per second).

Approach: Show all steps clearly. State the formula

used explicitly. Sample Question 3: Explain the process of radioactive decay. Expected Answer: Radioactive decay is a random process where an unstable nucleus loses energy by emitting radiation. The decay results in a change in the nucleus, transforming it into a different element or isotope. The rate of decay is characterized by the half-life. Decay is probabilistic; it cannot be predicted exactly when a particular nucleus will decay. Marking Points: Mention of emission of alpha, beta, or gamma radiation. The concept of half-life. The randomness of decay process. Tips for Using the November 2013 Mark Scheme to Maximize Exam Performance To utilize the mark scheme effectively, students should follow these strategies: 1. answer is considered correct. How to award partial marks for partially correct responses. Recognizing alternative valid approaches or explanations. This systematic approach ensures consistency across examiners and fairness for students. Partial and Full Credit Allocation Particularly in complex questions, the scheme allocates marks to specific steps or components. For example: Correct identification of variables in a problem may earn 1 mark. Correct application of a formula might earn 2 marks. A complete, correctly reasoned answer could be worth 4 or more marks. When students demonstrate partial understanding, the scheme encourages awarding partial credit rather than zero, motivating a nuanced evaluation. Common Pitfalls and Misconceptions Addressed The mark scheme anticipates typical errors, such as: Misapplication of formulas. Sign errors in vector components. Incorrect units or conversions. Misinterpretation of data or graphs. Examiners are guided to award marks for correct reasoning even if the final answer is incorrect, provided the student demonstrates appropriate understanding. Implications for Teaching and Student Preparation Guidance for Educators Understanding the mark scheme helps teachers: Design lessons that target key assessment criteria. Develop practice questions aligned with the marking standards. Provide targeted feedback to students, emphasizing areas where marks are often lost. Foster exam strategies, such as stepwise problem-solving and clear communication. Student Strategies for Success Students can leverage the mark scheme by: Practicing structured answers that mirror the expected responses. Learning to explain reasoning clearly, not just arriving at answers. Checking units, significant figures, and labels thoroughly. Recognizing the importance of diagram accuracy and annotations. Mechanics: An object is dropped from rest from a height of 80 m. Calculate the time taken to reach the ground, assuming air resistance is negligible. (Take $g = 9.8 \text{ m/s}^2$)

Electricity: A circuit contains a resistor of resistance 10Ω and a voltmeter across it reads 12 V. Calculate the current flowing through the resistor.

Waves: A wave with a frequency of 500 Hz has a wavelength of 0.68 m. Calculate the speed of the wave.

Atomic Physics: A radioactive isotope has a half-life of 3 hours. How much of a 100 g sample remains after 9 hours?

Answers:

($t = \sqrt{\frac{2h}{g}} = \sqrt{\frac{2 \times 80}{9.8}} \approx 4.04$, seconds)

($I = \frac{V}{R} = \frac{12}{10} = 1.2$, A)

($v = f \lambda = 500 \times 0.68 = 340$, m/s)

After 9 hours, $\frac{1}{8}$ of the original remains (since 9 hours = 3 half-lives), so remaining mass = $(100 \times \frac{1}{8}) = 12.5$, g).
