Extended response questions: Involve complex problem-solving, often with multiple steps, graphs, and applications.

Detailed Analysis of Selected Questions from the 2014 June Exemplar

To understand the depth and expectations of the exemplar, let's analyze some representative questions across different sections.

Section A: Multiple-Choice Example

Question: If $f(x) = 2x^2 - 3x + 5$, what is the value of $f(3)$?

Analysis: This straightforward question assesses basic substitution skills. The correct approach involves replacing x with 3: $f(3) = 2(3)^2 - 3(3) + 5 = 2(9) - 9 + 5 = 18 - 9 + 5 = 14$. Understanding such questions underpins more complex problem-solving in the exam.

Section B: Short-answer Example

Question: Solve for x : $x^2 - 4x - 5 = 0$.

Analysis: This requires application of quadratic solving methods, such as factoring or using the quadratic formula.

Factoring: $(x - 5)(x + 1) = 0$

Solutions: $x = 5$ or $x = -1$

This tests algebraic manipulation skills and understanding of quadratic solutions.

Section C: Extended Response Example

Question: A particle moves along a straight line. Its velocity at time t (in seconds) is given by $v(t) = 3t^2 - 6t$. Find:

- The total distance traveled in the first 4 seconds.
- The times when the particle changes direction.

Analysis: This multi-part question assesses calculus and kinematic interpretation.

Total distance: First, find when velocity is positive or negative to determine the direction. Find zeros of $v(t)$: $3t^2 - 6t = 0 \Rightarrow 3t(t - 2) = 0 \Rightarrow t = 0, 2$. Evaluate the absolute value of velocity over intervals: $t \in [0, 2], v(t) \geq 0$; $t \in [2, 4], v(t) \leq 0$. Calculate displacement in each interval: $\text{Distance} = \int_0^2 v(t) dt + \int_2^4 |v(t)| dt$. Since $v(t)$ is negative on $[2, 4]$, take the negative: $\text{Total distance} = \int_0^2 (3t^2 - 6t) dt - \int_2^4 (3t^2 - 6t) dt$. Carry out the integrations and sum the absolute values to get the total distance.

Direction change points: Occur at points where $v(t) = 0$, i.e., at $t = 0$ and $t = 2$. This question exemplifies the integration of calculus with physical interpretation, demanding comprehensive problem-solving skills.
